

## Xenotech Projects

### Project Variables Introduction (#131)

#### **Xenotech Variable Text Entry Methods and Examples**

[see detailed Projects on each of the following methods ]

Methods:

1. Use [PgDn] to create new plate and manually update new plate with variable data.  
 Generally used when just a few plates are needed ( 2-10 ).  
 Generally used when there is only one variable in the layout.
2. **Misc | CopyInput** data from Menu bar  
 Generally used when there are more than 10 plates &/or there are more than one variable per plate.  
 Generally used when your customer hands you a disk with the names (or etc) already created.
3. Copy/Paste to/from Windows™ clipboard.  
 Easiest and best of all! Normally saves scores of keystrokes, ⌘, ⌘, and file cleanups!  
 As of this date, totally undocumented in Xenotech books and online help files.
4. Advanced Technique:  
 Plates with different number of lines -- No layout!
